What is the risk meter?

The risk meter indicates the level of the risk of the investments in a risk profile. This risk is based on the volatility of the return and the correlation between the different investment categories. The standardised graphical representation gives you more of a point of reference when comparing the different profile names that are used in the market. The risk meter indicates the volatility of the investments in a risk profile in the future, but is no guarantee.

The principles of the risk meter:

- The risk meter assumes a diversified investment portfolio. A less diversified investment portfolio mostly entails a higher risk. Therefore please also read the information about the diversification risk.
- The risk meter assumes a long time horizon. The shorter the time horizon and the more volatile the share prices, the less time there is to compensate poor returns with good returns.
- The risk meter concerns the investment mix in a profile and not the actual investments.

What is neutral weighting?

The neutral weighting is the portion of the portfolio that is invested in a certain investment category under neutral market conditions. This portion is expressed as a percentage. For example: under the Neutral risk profile, there is a neutral weighting of 50% in the investment category shares. Depending on the current situation on the financial markets, we adjust the weightings. However, the weightings will always remain within the bandwidths of your risk profile.
